# 1 *Introduction*

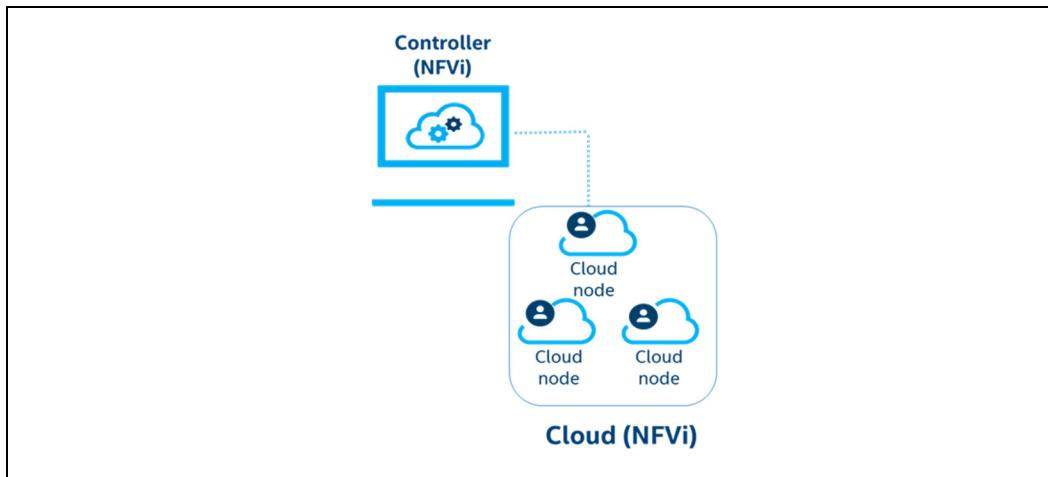

---

Intel Accelerated Solutions are a family of workload-optimized, infrastructure solutions, based on the Intel® Xeon® Scalable processor family targeting complex workloads of today. This document describes a reference implementation for the 4<sup>th</sup> Gen Intel® Xeon® Scalable processor family.

When network operators, service providers, cloud service providers, or enterprise infrastructure companies choose an Intel Verified Reference Configuration (VRC) for Network Function Virtualization Infrastructure (NFVI) deployment based upon an Intel® Xeon® Processor Scalable Family-based Intel VRC, they should be able to deploy various network function virtualized applications more securely and efficiently than ever before. End users spend less time, effort, and expense evaluating hardware and software options. Intel VRCs help end users simplify design choices by bundling hardware and software pieces together while making the high performance more predictable.

Intel VRCs for NFVI v4 are based on a multi-node architecture that consists of a controller, a cloud node and storage at a minimum. Thus, it is expected that the Intel VRC for NFVI provides all required resources to implement a software-defined infrastructure that resides within each cloud server instance and is controlled by the hypervisor. The Controller Node is intended to be used for control, signaling and management implementing the Virtual/Container Network Function (VNF) Management (VNFM) and Virtualization Infrastructure Management (VIM). Thus it may not require additional local storage and hardware acceleration.

**Figure 1. Intel® Verified Reference Configurations for NFVI Environment**

All Intel VRCs feature a workload-optimized stack tuned to take full advantage of an Intel® Architecture (IA) foundation. To be certified as an Intel VRC, Original Equipment Manufacturer (OEM) systems must meet a performance threshold that represents a premium customer experience.

There are two configurations for Intel VRCs for NFVI reference designs for the Cloud Node:

## ***Introduction***

- Intel VRCs for NFVI Plus configuration for the Cloud Node is defined with at least a 32-core 4th Generation Intel® Xeon® Scalable processor and high-performance network, with storage and integrated platform acceleration products from Intel® for maximum virtual machine density.
- Intel VRCs for NFVI Base configuration for the Cloud Node is defined with a 24-core or higher 4th Generation Intel® Xeon® Scalable processor and network, with storage and add-in platform acceleration products from Intel® targeting for optimized value and performance-based solutions.

There is also a configuration for Intel VRCs for NFVI reference designs for the Controller Node:

Intel VRCs for NFVI configuration for the Controller Node for NFVI is defined with at least a 24-core or higher 4th Generation Intel® Xeon® Scalable processor and network adapters to be able to communicate with all the cloud nodes. Application storage and add-in platform acceleration products may not be required for bare bone controller functionality to manage and communicate with Cloud nodes.

Bill of Materials (BOM) requirement details for the configurations are provided later section of this document.

Intel VRCs for NFVI are defined in collaboration with Communication Service Provider and ecosystem partners to demonstrate the value of an I/O Balanced Architecture for Network Function Virtualization. The solution leverages the hardened hardware, firmware, and software to allow customers to integrate on top of this known good foundation.

With the steady rise of cloud-based network traffic, edge computing has become increasingly more important to process this larger amount of data efficiently. By processing data at the network edge, latency for applications and services is reduced while potentially heavy traffic loads at the data center level, are alleviated by the distribution of traffic among the edge branches. However, this expanded network radius also corresponds to a wider attack range for a potential security threat. With these challenges in mind, Secure Access Service Edge (SASE) is intended to deliver a comprehensive solution for providing strong computational capability at the edge, securing the larger service area, and easily deploying new branches of the network.

Intel VRC for NFVI with SASE provides numerous benefits to ensure end users have excellent performance for their network applications. Some of the key benefits of the Intel VRC based on the 4th Generation Intel® Xeon® Scalable Processor Family processor include:

- High core counts and per-core performance
- Compact, power-efficient system-on-chip (Soc) platform
- Streamlined path to cloud-native operations
- Accelerated AI inference
- Accelerated encryption and compression
- Platform-level security enhancements

**Figure 2. SASE Use Cases**

## 1.1 Terminology

**Table 1. Terminology**

Term	Description
AIC	Add-In Card
API	Application Program interface
AGF	Access Gateway Function
BIOS	Basic Input/Output System
BOM	Bill of Materials
BtG	Boot Guard Technology
CUPS	Control Plane and User Plane Separation
DC	Data Center
DIMM	Dual Inline Memory Module
DPDK	Data Plane Development Kit
DRAM	Dynamic Random Access Memory
DUT	Device Under Test
ECDH	Elliptic Curve Diffie-Hellman protocol
ECDSA	Elliptic Curve Digital Signature Algorithm
GbE	Gigabit Ethernet
HQoS	Hierarchical Quality of Service
Intel® QAT	Intel® QuickAssist Technology
Intel® TXT	Intel® Trusted Execution Technology
Intel® UPI	Intel® Ultra Path Interconnect
Intel® VT	Intel® Virtualization Technology
Intel VRC	Intel Verified Reference Configuration
MLC	Memory Latency Checker
NAT	Network Address Translation
NFVI	Network Function Virtualization Infrastructure

<b>Term</b>	<b>Description</b>
NIC	Network Interface Controller
NUMA	Non-Uniform Memory Access
NVMe*	Non-Volatile Memory Express*
OAM	Operation, Administration and Management
OCP	Open Compute Project
OEM	Original Equipment Manufacturer
PCIe*	Peripheral Component Interconnect express*
PHY	Physical Layer
PXE	Pre-boot Execution Environment
QinQ	A standard that allows multiple VLAN headers in an Ethernet frame
RAS	Reliability, Availability, and Serviceability
SASE	Secure Access Service Edge
SR-IOV	Single Root Input/Output Virtualization
SSD	Solid State Drive
TCO	Total Cost of Ownership
TPM	Trusted Platform Module
Intel® TXT	Intel® Trusted Execution Technology
TPM	Trusted Platform Module
Intel® UPI	Intel® Ultra Path Interconnect
VIM	Virtualization Infrastructure Management
VMX	Virtual Machine Extension
VNFM	Virtual Network Function Management
VRC	Verified Reference Configuration
Intel® VT	Intel® Virtualization Technology

§

## 2 Solution Components

Intel VRCs consists of select hardware, various Intel® Xeon® processor technologies along with optimized software and firmware configurations. It consists of the components below.

**Figure 2. Solution Overview**

### 2.1 Intel® Xeon® Processor Scalable Performance Family

Intel® Xeon® Scalable processors are designed to accelerate performance across the fastest-growing workloads. These processors have the most built-in accelerators of any CPU on the market to help maximize performance efficiency for emerging workloads, especially those powered by AI.

In addition to delivering outstanding general-purpose performance, Intel® Xeon® drives efficiency with built-in accelerators. Data center operators can leverage built-in AI, telemetry, and power management tools for intelligent control electricity usage.

Intel's innovative workload accelerators enable end users to do more with less reducing TCO by delivering performance, power, resource, and cost efficiency as well as providing advanced security technologies.

The 4th Gen Intel® Xeon® Scalable Processors (formerly codenamed Sapphire Rapids) are the latest processors for Datacenter workloads that offer:

- **Enhanced Per Core Performance** with up to 60 cores in a standard socket
- **Enhanced Memory Performance** with support for up to 4800MT/s DIMMs (2 DPC)
- Increased Memory Capacity with up to 8 channels
- **Breakthrough System Memory & Storage** with Intel® Optane™ persistent memory 200 series

- **Built-in AI Acceleration** with enhanced performance of Intel® Deep Learning Boost
- **Faster UPI** with 3 Intel® Ultra Path Interconnect (Intel® UPI) at 11.2 GT/s
- **More, Faster I/O** with PCI Express 4 and up to 64 lanes (per socket) at 16 GT/s
- **New Hardware-Enhanced Security** delivering security technologies leadership with Intel® SGX, Intel® TME, Intel® PFR etc.
- **Enhanced Intel® Speed Select Technology (Intel® SST)** with three capabilities supported on the majority of Gold CPUs

## 2.2 Intel® C741 Chipset (codenamed: Emmitsburg) Platform Controller Hub

The Emmitsburg PCH provides extensive I/O support. The functions and capabilities are as follows:

- ACPI Power Management Logic Support, Revision 4.0a
- PCI Express Base Specification, Revision 4.0
- Integrated Serial ATA host controller supports data transfer rates of up to 6 b/s on all ports.
- xHCI USB controller with 10 USB 3.2 Gen 1 and 14 USB2 ports
- Serial Peripheral Interface
- Enhanced Serial Peripheral Interface
- Flexible I/O—Allows some high speed I/O signals to be configured as PCIe root ports, SATA, or USB 3.2 Gen 1
- General Purpose Input Output (GPIO)
- Interrupt controller, and timer functions
- System Management Bus Specification, Version 2.0
- Integrated Clock Controller/Real Time Clock Controller
- Intel® High-Definition Audio (Intel® HD Audio)
- Integrated 10/100/1000 Mbps Ethernet MAC
- Supports Intel® Rapid Storage Technology enterprise (Intel® RSTe)
- Supports Intel® Active Management Technology and Intel® Server Platform Services (Intel® SPS)
- Supports Intel® Virtualization Technology (Intel® VT) for Directed I/O (Intel® VT-d)
- Supports Intel® Trusted Execution Technology (Intel® TXT)
- JTAG Boundary Scan support
- Intel® Trace Hub (Intel® TH) for debug
- ADR Support

## 2.3 Intel® Ethernet 800 Series

Intel® Ethernet 800 Series offers:

- **Higher Bandwidth** as Intel's first NIC with PCIe\* 4.0 and 50Gb PAM4 SerDes
- **Improved Application Efficiency** with Application Device Queues (ADQ), Dynamic Device Personalization (DDP)
- **Versatility** with Flexible speeds: 2x100/50/25/10GbE, 4x25/10GbE, or 8x10GbE
- **RDMA support** for both iWARP and RoCEv2 providing a choice in hyper-converged networks

### 2.3.1 Intel® Network Adapter with Data Plane Development Kit (DPDK)

Intel® Network Products offer continuously innovative solutions for high throughput and performance for networking infrastructure. The Intel® Network Adapter with Data Plane Development Kit (DPDK) provides highly optimized Network Virtualization and fast data path packet processing. DPDK offers many use cases that are hardened on this Intel® Accelerated Solution for NFVI Forwarding Platform.

### 2.3.2 Intel® Ethernet 800 Series Dynamic Device Personalization (DDP)

Dynamic Device Personalization (DDP) usage to reconfigure network controllers for different network functions on-demand, without the need for migrating all VMs from the server, avoids unnecessary loss of compute for VMs during server cold restart. It also improves packet processing performance for applications/VMs by adding the capability to process new protocols in the network controller at run-time.

This kind of on-demand reconfiguration is offered in the Intel® Ethernet 800 Series NICs.

Dynamic Device Personalization describes the capability of the Intel® Ethernet 800 Series devices to load an additional firmware profile on top of the device's default firmware image, enabling parsing and classification of additional specified packet types that can be distributed to specific queues on the NIC's host interface using standard filters. Software applies these custom profiles in a non-permanent, transaction-like mode so that the original network controller's configuration is restored after NIC reset or by rolling back profile changes by software. Using APIs provided by drivers, personality profiles can be applied by the DPDK. Support for kernel drivers and integration with higher level management/orchestration tools is in progress.

DDP can be used to optimize packet processing performance for different network functions, native or running in virtual environment. By applying a DDP profile to the network controller, the following use cases could be addressed.

A general purpose, OS-default DDP package is automatically installed with all supported Intel® Ethernet Controller 800 Series drivers on Microsoft\* Windows\*, ESX\*, FreeBSD\*, and Linux\* operating systems. Additional DDP packages are available to address needs for specific market segments. For example, a telecommunications (Comms) DDP package is available to support certain market-specific protocols in addition to the protocols in the OS-default package.

- The OS-default DDP package supports the following:
  - MAC, EtherType, VLAN
  - IPv4, IPv6, TCP, ARP, UDP
  - SCTP, ICMP, ICMPv6, CTRL
  - LLDP, VXLAN-GPE, VXLAN (non-GPE), Geneve, GRE, NVGRE, RoCEv2
  - MPLS (up to 5 consecutive MPLS labels in the outermost Layer 2 header group)
- In addition to the previous list, the Comms DDP package also supports the following protocols:
  - GTP
  - PPPOE
  - L2TPv3
  - IPSec
  - PFCP

## 2.4 Intel® Xeon® Scalable Platform Technologies

### 2.4.1 Intel® Hyper-Threading Technology (Intel® HT Technology)

Enables multiple threads to run on each core, which ensures that systems use processor resources more efficiently. Intel® HT Technology also increases processor throughput, improving overall performance on threaded software.

### 2.4.2 Intel® Turbo Boost Technology

Accelerates processor and graphics performance for peak loads, automatically allowing processor cores to run faster than the rated operating frequency if they're operating below power, current, and temperature specification limits.

### 2.4.3 Intel® Speed Select Technology (Intel® SST)

Intel® Speed Select Technology is a collection of features that improve performance and optimize TCO by providing more control over CPU performance. With Intel® SST, one server can do more.

- **Intel® SST-BF:** Trade off base frequency between higher and lower priority cores
- **Intel® SST-TF:** Capability to configure turbo frequencies beyond traditional max frequency limit
- **Intel® SST-CP:** Capability to allocate Surplus frequency to highest priority cores
- **Intel® SST-PP:** Capability to configure the CPU to run at 3 distinct operating points or profiles

### 2.4.4 Intel® Virtualization Technology (Intel® VT)

Intel® Virtualization Technology (Intel® VT) provides hardware abstraction to allow multiple workloads to co-exist and share common resources while maintaining full isolation.

The Intel® VT portfolio includes the capability in the CPU to implement Virtual Machine Extension (VMX) instructions. These allow all software in the Virtual Machine to run natively without performance impact from operations such as instruction translation and page table swaps with memory virtualization support.

Intel® VT also includes input/output (I/O) virtualization that supports offloading packet processing to network adapters, directly assigning virtual functions to virtual machines with Single Root I/O Virtualization (SR-IOV) and Intel® Data Direct I/O Technology Enhancement (Intel® DDIO), providing native network performance in the VM.

To obtain all the benefits of Intel® VT, Intel VRCs for Network Function Virtualization Infrastructure (NFVI) are required to have all virtualization technology features enabled.

## 2.4.5

### Intel® Resource Director Technology (Intel® RDT)

Intel® Resource Director Technology (Intel® RDT) are collection of advanced technologies providing control over shared platform resources

**Cache Monitoring Tech (CMT):** Per-thread L3 Occupancy Monitoring

**Cache Allocation Tech (CAT):** Per-thread L3 Occupancy Control, New Code/Data Prioritization (CDP) extension

**Memory BW Monitoring (MBM):** Per-thread Memory Bandwidth Monitoring

**Memory Bandwidth Allocation (MBA):** Per-core Bandwidth Control – more precisely control “noisy neighbors”

## 2.4.6

### Intel® On Demand

Intel® On Demand (formerly SDSI) is a new capability offering on demand one-time activation of incremental features during the Intel® Xeon CPU Life Cycle. Once enabled through a backend infrastructure, a hardened SW architecture for license delivery, with automated billing. License provisioning on the platform via out of band and in band communication for the one-time activation of features. CPU Features include: SGX, IAA, QAT, DLB, DSA.

## 2.4.7

### Intel® Accelerator Interfacing Architecture (AiA)

Accelerator Interfacing Architecture (AiA) includes work submission, new instructions that provides low latency user-space work dispatch and synchronization between software and accelerators. AiA improves overall performance of the system for use in conjunction with the integrated accelerators in CPU, as well as discrete accelerators like NIC, GPU, FPGA-instantiated accelerators.

## 2.4.8

### Intel® Deep Learning Boost

Intel® Deep Learning Boost includes extensive hardware inside CPU to provide set of instructions to accelerate Artificial Intelligence (AI) or Deep Learning Inference and training workload. Instructions include intel Deep Learning Boost i.e. VNNI/INT8, BF16 and with 4<sup>th</sup> Gen Intel® Xeon Scalable Processor the new Intel® AMX/TMUL instructions with INT8 and BF16 support.

## 2.4.9 Intel® Dynamic Load Balancer (DLB)

Intel® Dynamic Load Balancer previously known as Hardware Queue Manager improves the system performance related to handling network data on multi-core Intel® Xeon Scalable processors:

1. Distributed Processing - Intel® DLB enables the efficient distribution of network processing across multiple CPU cores/threads.
2. Dynamic Load Balancing - Intel® DLB dynamically distributes network data across multiple CPU cores for processing as the system load varies.
3. Dynamic Network Processing Reordering- Intel® DLB restores the order of networking data packets processed simultaneously on CPU cores.

## 2.4.10 Next-Gen Intel® QuickAssist Technology (Intel® QAT)

This product contains Intel® QuickAssist Technology which is integrated into the Processor with the following functions:

- Cryptographic Functions
  - Cipher Operations
  - NULL, AES
  - Snow3G UEA2
  - ZUC/128-EEA3(64B/1024B)
  - SM4
  - AES-GCM: Single Pass
  - CHACHA20-POLYHash Operation
  - NULL, SHA-1
  - SHA-224/256
  - SHA-384/512
  - AES-(X)CBC-MAC
  - Galois Hash 64/128
  - UIA2 (Snow3G)
  - SHA3-224(64B/1024B)
  - SHA3-256(64B/1024B)
  - SHA3-384(64B/1024B)
  - SHA3-384(64B/1024B)
  - SHA3-512(64B/1024B)
  - ZUC/EIA3(64B/1024B)
  - SM3(64B/1024B)
- Authentication Operation
  - SHA1, SHA-256, SHA-512, SHA-224, SHA-384, SHA3-256, SHA3-512,
  - SHA3-224, SHA3-384, SM3, All HMAC variations
  - AES-CBC-MAC, AES-XCBC-MAC, GHASH64 (GMAC), GHASH128 (GMAC)
- Wireless Authentication Operation
  - AES-CBC-MAC, AES F9, SNOW3G UIA2, ZUC (128-EIA3)
- Cipher-Hash Combined Operation
- Key Derivation Operation
- Wireless Cryptography
  - AES, SM4, SNOW 3G\*(UEA2), ZUC(128-EEA3)
  - Public Key Functions

## Solution Components

- RSA Operation
- Diffie-Helman Operation
- Digital Signature Standard Operation
- Key Derivation Operation
- Elliptic Curve Cryptography: ECDSA\* and ECDH\*
  - Compression/Decompression Functions
- DEFLATE, LZ4s, LZ4

### 2.4.11

#### Intel® Data Streaming Accelerator (DSA)

**4th Gen Intel® Xeon® Scalable Processors** incorporate Intel® Data Streaming Accelerator Technology version 1.0 through a data accelerator for improving the performance of storage, networking, and various other I/O applications. The DMA engine is optimized for moving data between memory. The Intel® Data Streaming Accelerator replaces Intel® QuickData Technology used in previous Server processor generations. For more details, refer to Intel® Data Streaming Accelerator Specification, <https://software.intel.com/content/www/us/en/develop/articles/intel-data-streamingaccelerator-architecture-specification.html>

### 2.4.12

#### Intel® In-Memory Analytics Accelerator (Intel® IAA)

Intel® IAA **increases query throughput** and **decreases memory footprint** via:

1. Deeper compression than software-only techniques
2. More effective bandwidth, as deeply compressed data consumes less bandwidth
3. Core offload, as IAA performs computationally demanding scan and filter operations in place of cores.

### 2.4.13

#### Intel® Volume Management Device (VMD) & Intel® Virtual RAID on CPU (VROC)

Intel® VMD and Intel® VROC together provide RAS features for NVMe storage with maximum system up-time, ease of maintenance, cost-effective RAID solution and better NVMe performance in virtualization applications.

### 2.4.14

#### Intel® Seamless Firmware Update Technology

Intel® Seamless Firmware Update Technology is a cutting-edge solution from Intel that updates microcode with no perceived degradation to the services running on the platform. This technology is able to aggregate Intel firmware updates during run time without interrupting system operation. Also. it maintains server uptime while updating and activating firmware components.

### 2.4.15

#### Hardware Enhanced Security Features

4th Gen Intel® Xeon® Scalable Processors offer new hardware enhanced security features:

- **Intel® Software Guard Extensions (Intel® SGX) with additional integrity feature:** Provides fine grain data protection via application isolation in memory. Integrity provides greater resistance against physical attacks
- **Intel® Platform Firmware Resilience (Intel® PFR):** Verification of platform firmware images now extended to peripherals
- **Software Hardening Execution Controls:** Intel Virtualization Technology-Redirect Protection (formerly HLAT) - Enhanced page-table protections for OS kernel. Control flow Enforcement Tech (CET) - Return Oriented Programming (ROP), Jump Oriented Programming (JOP), Call Oriented Programming (COP) attack prevention with Shadow Stack and ENDBRANCH.
- Intel® Total Memory Encryption (**Intel® TME-MK**): Hardware-enabled memory encryption designed for multi-tenant server platforms. Also supports full memory encryption via single key

#### 2.4.16 Trusted Platform Module (TPM)

TPM protects the system start-up process by ensuring it is tamper-free before releasing system control to the operating system. TPM 1.2 also provides secured storage for sensitive data, such as security keys and passwords, and performs encryption and hash functions.

Intel® Trusted Execution Technology (Intel® TXT) utilizes this technology.

#### 2.4.17 Intel® Trusted Execution Technology (Intel® TXT)

Intel® TXT provides the foundation for highly scalable platform security in physical and virtual infrastructures. It helps harden servers at the hardware level against threats of hypervisor, BIOS, or other firmware attacks, malicious rootkit installations, and other types of attacks or misconfiguration to firmware and operating systems.

#### 2.4.18 Intel® Hyper-Threading Technology (Intel® HT Technology)

Intel® HT Technology enables multiple threads to run on each core, which ensures that systems use processor resources more efficiently. Intel® HT Technology also increases processor throughput, improving overall performance on threaded software.

#### 2.4.19 Intel® Boot Guard (Security)

Hardware-based boot integrity protection prevents unauthorized software and malware takeover of boot blocks critical to a system's function, thus providing added level of platform security based on hardware.

## 3 Design Compliance Requirements

---

This chapter focuses on the design requirements for Intel VRC for NFVI.

### 3.1 Intel VRC Hardware Requirements

The checklists in this chapter provide guidance for assessing the conformance to the Intel® Verified Reference Configuration for NFVI hardware platform requirement for the Cloud Node Base Configuration, Cloud Node Plus Configuration, Controller Node. For the platform to conform to the desired Intel® Verified Reference Configuration for NFVI, all requirements in the checklist must be met.

**Table 3. Intel VRC for NFVI Plus Configuration- the Cloud Node HW Configuration**

Ingredient	Requirement	Required/ Recommended	Quantity
Processor	Intel® Xeon® Gold 6438N Processor at 1.8GHz, 32C/64T, 205W or higher number SKU	Required	2
Memory	Option 1: DRAM only configuration: 512 GB (16x 32 GB DDR5, 4800 MHz)	Required	16
	Option 2: DRAM only configuration: 512 GB (32x 16 GB DDR5, 4800 MHz)		32
Network <sup>1</sup>	Intel® Ethernet Network Adapter E810-2CQDA2	Required	4 (2 per NUMA node)
Storage (Boot Drive)	480 GB or equivalent boot drive	Required	1
Storage (Capacity)	3.84 TB or equivalent drive (recommended NUMA aligned)	Recommended	4 (2 per NUMA node)
LAN on Motherboard (LOM)	10 Gbps or 25 Gbps port for Pre-boot Execution Environment (PXE) and Operation, Administration and Management (OAM)	Required	4 (2 per NUMA node)
	1/10 Gbps port for Management NIC		1

**Table 4. Intel VRC for NFVI Base Configuration – the Cloud Node HW Configuration**

Ingredient	Requirement	Required/ Recommended	Quantity
Processor	Intel® Xeon® Gold 5418N processor at 1.8 GHz, 24C/48T, 165W or higher number SKU	Required	2
Memory <sup>1</sup>	DRAM only configuration: 256 GB (16x 16 GB DDR5, 4800 MHz)	Required	16

Ingredient	Requirement	Required/ Recommended	Quantity
Network <sup>2</sup>	Option 1 – Intel® Ethernet Network Adapter E810-CQDA2	Required	4 (2 per NUMA node)
	Option 2 – Intel® Ethernet Network Adapter E810-2CQDA2		2 (1 per NUMA node)
Storage (Boot Drive)	480 GB or equivalent boot drive	Required	2
Storage (Capacity)	3.84 TB or equivalent drive (recommended NUMA aligned)	Recommended	2 (1 per NUMA node)
LAN on Motherboard (LOM)	10 Gbps or 25 Gbps port for PXE/OAM	Required	2
	1/10 Gbps port for Management NIC	Required	1

**Table 5. Intel VRC for NFVI – Controller Node HW Configuration**

Ingredient	Requirement	Required/ Recommended	Quantity per Node
Processor <sup>1</sup>	Intel® Xeon® Gold 5418N processor at 1.8 GHz, 24C/48T, 165W (SST-PP config 2) or higher number SKU	Required	2
Memory <sup>2</sup>	DRAM only configuration: 256 GB (16x 16 GB DDR5, 4800 MHz)	Required	16
Network <sup>3</sup>	Option 1 – Intel® Ethernet Network Adapter E810-CQDA2	Required	2
	Option 2 – Intel® Ethernet Network Adapter E810-CQDA2 with Ethernet Port Configuration Tool (EPCT) to break down interface to 4x25G on single port or 8x10G mode (4x10 on single port)		
	Option 3 – Intel® Ethernet Network Adapter E810-XXVDA2		
Storage (Boot Drive)	480 GB or equivalent boot drive	Required	2
Storage (Capacity)	3.84 TB or equivalent drive (recommended NUMA aligned)	Required	2 (1 per NUMA node)
LAN on Motherboard (LOM)	10 Gbps or 25Gbps port for PXE/OAM	Recommended	2
	1/10 Gbps port for Management NIC	Required	1

## 3.2 Intel VRC Software Requirements

The table below is a guide for assessing the conformance to Intel Accelerated Solution for NFVI or SASE Intel Accelerated Solution for NFVI or SASE software requirements.

For the platform to conform the desired Intel Accelerated Solution for NFVI or SASE, all requirements listed in the checklist below must be satisfied.

**Table 5. Intel Accelerated Solution for NFVI or SASE – SW Configuration**

Ingredient	SW Version Details
DPDK	21.11.2
Intel® QAT	QAT 20.L.1.0.10-00005
Intel® Ethernet Network Adapter E810-CQDA2	CVL 4.10 0x800151a9 ice 4.18.0-372.40.1.el8_6.x86_64 iavf 4.18.0-372.40.1.el8_6.x86_64
Intel® Ethernet Network Adapter E810-2CQDA2	CVL 4.10 0x800151a9 ice 4.18.0-372.40.1.el8_6.x86_64 iavf 4.18.0-372.40.1.el8_6.x86_64
Red Hat	OpenShift version 4.12.1
Node Feature Discovery Operator	4.10.6
SR-IOV Network Operator	4.12.0-202303231115
Intel Device Plugins Operator	0.24.1
Kernel	4.18.0-372.40.1.el8_6.x86_64

**Note:**

1. Intel® recommends checking your system's exposure to the "Spectre" and "Meltdown" exploits.
2. Intel® QAT Software Package available from <https://developer.intel.com/quickassist>
3. The Intel® QAT driver is required to achieve the performance KPI's needed for certification. In the event of an issue, Red Hat\* may request the user reproduce the issue with the Intel® QAT In-Tree driver to rule out interaction with the Intel® QAT driver from <https://developer.intel.com/quickassist>. Refer to <https://access.redhat.com/articles/1067> which explains Red Hat\* Support policy for Out Of Tree (OOT) drivers.
4. The customer should be aware of Red Hat's Certified Guest Operating System policy here (tier 3 vs. tier 1): <https://access.redhat.com/articles/973163>
5. Intel® Ethernet Adapter E810-CQDA2 Non-Volatile Memory (NVM) Update Utility for Intel® Ethernet Network Adapter 810 Series can be found at the following link: <https://www.intel.com/content/www/us/en/download/19624/non-volatile-memory-nvm-update-utility-for-intel-ethernet-network-adapter-e810-series.html?wapkw=nvm%20update>

### 3.3 BIOS Settings

To meet the performance requirements for an Intel VRC for NFVI platform solution, Intel® recommends using the BIOS settings for enabling processor p-state and c-state with Intel® Turbo Boost Technology ("turbo mode") enabled. Hyper threading is

recommended to provide higher thread density. Intel® also recommends using the BIOS settings for on demand Performance with power consideration.

Refer to the document *BIOS Settings for Intel® Wireline, Cable, Wireless and Converged Access Platform (#747130)* **chapter 3** for information on the BIOS settings.

**Note:** BIOS settings differ from vendor to vendor. Please contact your Intel Representative if you do not see the exact setting in your BIOS.

## 3.4 Platform Technology Requirements

This section lists the requirements for Intel's advanced platform technologies.

NFVI requires Intel® VT and Intel® Scalable I/O Virtualization (Intel® Scalable IOV) to be enabled to reap the benefits of hardware virtualization. Either Intel® Boot Guard or Intel® Trusted Execution Technology establishes the firmware verification, allowing for platform static root of trust.

**Table 4. Platform Technology Requirements**

Platform Technologies		Enable/Disable	Required/Recommended
Intel® VT	Intel® CPU VMX Support	Enable	Required
	Intel® I/O Virtualization	Enable	Required
Intel® Boot Guard	Intel® Boot Guard	Enable	Required
Intel® TXT	Intel® Trusted Execution Technology	Enable	Recommended

## 3.5 Platform Security

Intel Accelerated Solutions for vRAN must enable Intel® Boot Guard Technology to verify that the platform firmware is suitable during the boot phase.

In addition to protecting against the known attacks, all Intel Accelerated Solutions recommend installing the Trusted Platform Module (TPM). The TPM enables administrators to secure platforms for a trusted (measured) boot with known trustworthy (measured) firmware and OS. This allows local and remote verification by third parties to advertise known safe conditions for these platforms through implementation of Intel® Trusted Execution Technology (Intel® TXT).

## 3.6 Side Channel Mitigation

Reference intimation protection is verified with Spectre and Meltdown exposure using the latest Spectre and Meltdown Mitigation Detection Tool, which confirms the effectiveness of firmware and operating system updates against known attacks.

§

## 4 Platform Tuning for Worker Node

---

### 4.1 Boot Parameter Setup

For the workload testing, it is first necessary to setup the worker node with appropriate boot parameters as well as 1GB hugepages. Create the following file called "99-worker-custom.bu":

```
variant: openshift
version: 4.12.0
metadata:
  name: 99-worker-custom
  labels:
    machineconfiguration.openshift.io/role: worker
openshift:
  kernel_arguments:
    - iommu=pt
    - intel_iommu=on
    - hugepagesz=1G
    - default_hugepagesz=1G
    - hugepages=150
    - vfio-pci.ids=8086:4943
```

Run the following commands:

```
butane 99-worker-custom.bu -o ./99-worker-custom.yaml
oc create -f 99-worker-custom.yaml
```

The worker node should automatically reboot to apply the changes.

### 4.2 Building QAT Driver and Using QAT Device Plugin

Follow the instructions provided below to build the QAT2.0 OOT Driver:

1. Download the QAT2.0 driver (QAT20.L.1.0.10-00005.tar.gz) from <https://www.intel.com/content/www/us/en/developer/topic-technology/open/quick-assist-technology/overview.html> by accessing the Linux\* Hardware v2.0 driver page.
2. Download the following RPM packages from the Red Hat Package Browser (<https://access.redhat.com/downloads/content/package-browser>).

**Note:** You need to have a Red Hat account to access this page

```
boost-1.66.0-10.el8.x86_64.rpm
boost-atomic-1.66.0-10.el8.x86_64.rpm
boost-chrono-1.66.0-10.el8.x86_64.rpm
boost-container-1.66.0-10.el8.x86_64.rpm
boost-context-1.66.0-10.el8.x86_64.rpm
boost-coroutine-1.66.0-10.el8.x86_64.rpm
boost-date-time-1.66.0-10.el8.x86_64.rpm
boost-devel-1.66.0-10.el8.x86_64.rpm
boost-fiber-1.66.0-10.el8.x86_64.rpm
boost-filesystem-1.66.0-10.el8.x86_64.rpm
boost-graph-1.66.0-10.el8.x86_64.rpm
boost-iostreams-1.66.0-10.el8.x86_64.rpm
```

```

boost-locale-1.66.0-10.el8.x86_64.rpm
boost-log-1.66.0-10.el8.x86_64.rpm
boost-math-1.66.0-10.el8.x86_64.rpm
boost-program-options-1.66.0-10.el8.x86_64.rpm
boost-random-1.66.0-10.el8.x86_64.rpm
boost-regex-1.66.0-10.el8.x86_64.rpm
boost-serialization-1.66.0-10.el8.x86_64.rpm
boost-signals-1.66.0-10.el8.x86_64.rpm
boost-stacktrace-1.66.0-10.el8.x86_64.rpm
boost-system-1.66.0-10.el8.x86_64.rpm
boost-test-1.66.0-10.el8.x86_64.rpm
boost-thread-1.66.0-10.el8.x86_64.rpm
boost-timer-1.66.0-10.el8.x86_64.rpm
boost-type_erasure-1.66.0-10.el8.x86_64.rpm
boost-wave-1.66.0-10.el8.x86_64.rpm
libicu-60.3-2.el8_1.x86_64.rpm
libicu-devel-60.3-2.el8_1.x86_64.rpm
libnl3-cli-3.5.0-1.el8.x86_64.rpm
libnl3-devel-3.5.0-1.el8.x86_64.rpm
libquadmath-8.5.0-16.el8_7.x86_64.rpm
libquadmath-devel-8.5.0-16.el8_7.x86_64.rpm
yasm-1.3.0-7.el8.x86_64.rpm

```

3. Create a tar archive of all the rpm files called "rpm\_packages.tar.gz":  
`tar -cf rpm_packages.tar.gz *.rpm`

4. Create the following script, naming the file "make\_qat\_driver.sh":

```

#!/bin/bash

yum update -y --allowerasing
yum install -y gcc gcc-c++ systemd-devel pciutils kmod
cd /home
tar -xvf rpm_packages.tar.gz

rpm -ivh yasm-1.3.0-7.el8.x86_64.rpm libicu-60.3-2.el8_1.x86_64.rpm
libquadmath-8.5.0-16.el8_7.x86_64.rpm
rpm -ivh libicu-devel-60.3-2.el8_1.x86_64.rpm libquadmath-devel-8.5.0-
16.el8_7.x86_64.rpm
rpm -ivh boost-atomic-1.66.0-10.el8.x86_64.rpm boost-container-1.66.0-
10.el8.x86_64.rpm boost-context-1.66.0-10.el8.x86_64.rpm boost-date-time-
1.66.0-10.el8.x86_64.rpm boost-iostreams-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-math-1.66.0-10.el8.x86_64.rpm boost-program-options-1.66.0-
10.el8.x86_64.rpm boost-regex-1.66.0-10.el8.x86_64.rpm boost-serialization-
1.66.0-10.el8.x86_64.rpm boost-signals-1.66.0-10.el8.x86_64.rpm boost-
stacktrace-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-system-1.66.0-10.el8.x86_64.rpm boost-thread-1.66.0-
10.el8.x86_64.rpm
rpm -ivh boost-chrono-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-coroutine-1.66.0-10.el8.x86_64.rpm boost-filesystem-1.66.0-
10.el8.x86_64.rpm boost-graph-1.66.0-10.el8.x86_64.rpm boost-locale-1.66.0-
10.el8.x86_64.rpm boost-log-1.66.0-10.el8.x86_64.rpm boost-random-1.66.0-
10.el8.x86_64.rpm boost-timer-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-type_erasure-1.66.0-10.el8.x86_64.rpm boost-wave-1.66.0-
10.el8.x86_64.rpm boost-test-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-fiber-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-1.66.0-10.el8.x86_64.rpm
rpm -ivh boost-devel-1.66.0-10.el8.x86_64.rpm
rpm -ivh libnl3-cli-3.5.0-1.el8.x86_64.rpm
rpm -ivh libnl3-devel-3.5.0-1.el8.x86_64.rpm

# Make QAT2.0
mkdir /root/QAT
mv QAT20* /root/QAT
cd /root/QAT
tar -xf *

```

```
./configure --enable-icp-sriov=host
make
make install
```

5. Using your Red Hat login information, run the following command:  

```
podman login registry.redhat.io
```
6. Create the following file called "qat\_driver\_spec.yaml":  

```
apiVersion: v1
kind: Pod
metadata:
  labels:
    run: qat-driver0
  name: qat-driver0
spec:
  containers:
  - args:
    - /usr/lib/systemd/systemd
    image: registry.redhat.io/openshift4/driver-toolkit-rhel8:v4.12.0-202301171655.p0.ge31abf2.assembly.stream
    name: qat-driver
    stdin: true
    securityContext:
      privileged: true
    nodeName: worker-0
    restartPolicy: Always
  a. Replace "worker-0" with the name of your worker node being used
```
7. Create and run the following script, naming the file "build\_qat.sh":  

```
#!/bin/bash

for i in 1 2
do
  oc delete pod qat-driver
  oc create -f ./qat_driver_spec.yaml
  sleep 90
  oc cp ./QAT20.L.1.0.10-00005.tar.gz qat-driver:/home
  oc cp ./rpm_packages.tar.gz qat-driver:/home
  oc cp ./make_qat_driver.sh qat-driver:/home
  oc exec -it qat-driver -- /home/make_qat_driver.sh
done
```
8. Run the following commands:  

```
oc cp qat-driver:/root/QAT/build/qat_4xxx.bin ./qat_4xxx.bin
oc cp qat-driver:/root/QAT/build/qat_4xxx_mmp.bin ./qat_4xxx_mmp.bin
```
9. Follow the steps in the "Loading custom firmware blobs in the machine config manifest" section at [https://docs.openshift.com/container-platform/4.12/post\\_installation\\_configuration/machine-configuration-tasks.html#rhcose-load-firmware-blobs\\_post-install-machine-configuration-tasks](https://docs.openshift.com/container-platform/4.12/post_installation_configuration/machine-configuration-tasks.html#rhcose-load-firmware-blobs_post-install-machine-configuration-tasks) to configure the "qat\_4xxx.bin" and "qat\_4xxx\_mmp.bin" files to be placed in the "/var/lib/firmware" directory
  - a. Use the following for the file "98-worker-firmware-blob.bu":  

```
variant: openshift
version: 4.12.0
metadata:
  labels:
    machineconfiguration.openshift.io/role: worker
  name: 98-master-firmware-blob
storage:
  files:
  - path: /var/lib/firmware/qat_c4xxx.bin
    contents:
      local: qat_4xxx.bin
    mode: 0644
```

```
- path: /var/lib/firmware/qat_c4xxx_mmp.bin
  contents:
    local: qat_4xxx_mmp.bin
    mode: 0644
openshift:
  kernel_arguments:
    - 'firmware_class.path=/var/lib/firmware'
b. To install butane, follow the steps at this link:
https://docs.openshift.com/container-platform/4.12/installing/install\_config/installing-customizing.html
c. The system should automatically reboot after this step
```

10. Every time the system is restarted, the "build\_qat.sh" script must be run.

To deploy the QAT Device Plugin in order to utilize QAT resources in Pods, follow the steps here: [https://github.com/mreqmi/intel-device-plugins-for-kubernetes/tree/qat\\_enable/cmd/operator/ocp\\_quickstart\\_guide](https://github.com/mreqmi/intel-device-plugins-for-kubernetes/tree/qat_enable/cmd/operator/ocp_quickstart_guide).

## 5 Performance Verification

---

This chapter aims to verify the performance metrics for the reference intimation for NFVI to ensure that there is no anomaly seen. Refer to information in this section to ensure that the performance baseline for the platform is as expected.

The Plus solution was tested on March 29, 2023, with the following hardware and software configurations:

- 2 NUMA nodes
- 2x Intel® Xeon® Gold 6438N processors
- Total Memory: 512 GB, 16 slots/32 GB/4800 MT/s DDR5 RDIMM
- Hyperthreading: Enable
- Turbo: Enable
- C-State: Enable
- Storage: 1.8T INTEL SSDSC2KG01
- Network devices: 4x Single port Intel® Ethernet Network Adapter E810-CQDA2
- Network speed: 50 GbE
- BIOS: EGSDCRB1.SYS.9409.P09.2212301305
- Microcode: 0xab000190
- OS/Software: Red Hat CoreOS 412.86.202301191053-0 / Red Hat Enterprise Linux\* 8.6 (kernel 4.18.0-372.40.1.el8\_6.x86\_64)

### 5.1 Memory Latency Checker (MLC)

The first application is the Memory Latency Checker which can be downloaded from <https://www.intel.com/content/www/us/en/developer/articles/tool/intel-memory-latency-checker.html>

Download the latest version and execute this application, unzip the tarball package and go into Linux\* folder and execute `./mlc` or `./mlc_avx512`.

**Table 5-1. Memory Latency Checker**

Key Performance Metric	Local Socket
Idle Latency	100 ns
Memory Bandwidths between nodes within the system (using read-only traffic type) MB/s	260000

**Table 5-6. Peak Injection Memory Bandwidth (1 MB/sec) Using All Threads**

Peak Injection Memory Bandwidth (1 MB/sec) using all threads	Plus
All Reads	507000
3:1 Reads-Writes	469000
2:1 Reads-Writes	464000
1:1 Reads-Writes	447000
STREAM-Triad	436000
Loaded Latencies using Read-only traffic type with Delay=0 (ns)	200
L2-L2 HIT latency (ns)	62
L2-L2 HITM latency (ns)	63

**Note:** If the latency performance and memory bandwidth performance is outside the range, please verify the validity of the Platform components, BIOS settings, kernel power performance profile used and other software components.

## 5.2 NGINX\*

Intel® QAT hardware acceleration helps to offload public key exchange for SSL layer 7 application. Intel VRC for NFVI – Plus platform must be able to demonstrate the minimum 7700 Connection Per Second (CPS) with the full software stack of NGINX\* application with Intel® QAT HW (2 devices).

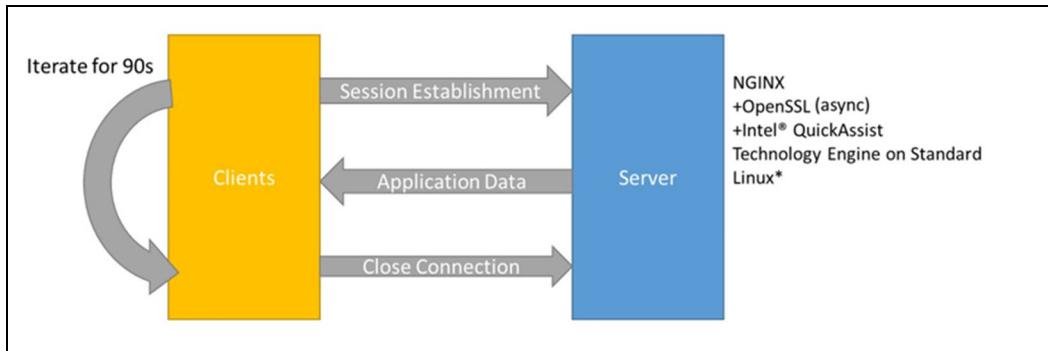

Intel VRC for NFVI - Plus Platform without Intel® QAT must demonstrate a minimum of 400 Connections Per Second (CPS) with the full software stack of NGINX\* application.

**Table 7. NGINX\* Workload Configuration**

Ingredient	Software Version Details
Async mode nginx	v0.4.7
OpenSSL	3.0.2
QAT Engine	v0.6.19
IPP Crypto	Ippcp_2021.7
IPSec MB	1.3

**Table 8. NGINX\* Performance Requirements**

Configuration <sup>1</sup>	Intel® QAT HW (2 devices)	Intel® QAT HW (1 device)	Intel® QAT-SW	Core Software
Intel® Verified Reference Configuration for NFVI - Plus platform	7700 CPS <sup>2,3</sup>	5400 CPS	1000 CPS	400 CPS
	<sup>1</sup> Uses ECDHE-X448-RSA4K TLS 1.3 handshakes <sup>2</sup> Intel® QAT HW (2 devices) is showing up to 16.8x performance over Core Software. <sup>3</sup> Intel® QAT HW (2 devices) is showing up to 7.2x performance over QAT-SW.			

**Figure 3. Test Methodology for SSL with NGINX\***

**Note:** Test Methodology and Procedures can be found in Appendix F.

The test methodology implements the following to measure the maximum CPS that the system can sustain:

- NGINX\* Server Stack Utilizing Intel® QAT Engine and OpenSSL\* 3.0.2+
- OpenSSL\* scripts running in a container simulate client traffic sending 0-byte requests to the server (HTTPS workloads).
- The test measures the number of connection requests per second that the server can sustain.

## 5.2.1 NGINX Test Methodology

Follow these steps in order to run the NGINX workload testing:

1. Make sure that the QAT driver has been setup as described in Section 5.2 The QAT driver container created there will be used to run the NGINX application.
2. Create the following file called "install\_nginx.sh":

```
#!/bin/bash

export ASYNC_NGINX_VERSION="v0.4.7"

yum update -y
```

```
yum install -y libudev-devel make gcc gcc-c++ pkg-config openssl-devel zlib-devel wget git autoconf cmake libtool
yum install -y nasm # This is the only one that doesn't work

cd /home
git clone --depth 1 -b $ASYNC_NGINX_VERSION
https://github.com/intel/asynch_mode_nginx.git

cd /home/asynch_mode_nginx
./configure --prefix=/var/www --conf-path=/usr/share/nginx/conf/nginx.conf --
sbin-path=/usr/bin/nginx --pid-path=/run/nginx.pid --lock-
path=/run/lock/nginx.lock --modules-path=/usr/lib64/nginx --without-
http_rewrite_module --with-http_ssl_module --add-dynamic-
module=modules/nginx_qat_module/ --with-cc-opt="-DNGX_SECURE_MEM -I/include -
Wno-error=deprecated-declarations" --with-ld-opt="-L/src"
make && make install
```

3. Create the following file called "qat\_hw\_setup.sh":

```
#!/bin/bash

cd /home
git clone --depth 1 https://github.com/intel/QAT_Engine
yum install -y autoconf automake libtool openssl-devel

cd /home/QAT_Engine
./autogen.sh
./configure --enable-qat_hw --with-qat_hw_dir=/root/QAT
make && make install
```

4. The QAT configuration files need to be modified to use with the NGINX workload. Create the following file "4xxx\_dev0.conf":

```
[GENERAL]
ServicesEnabled = asym
ConfigVersion = 2
FirmwareAuthEnabled = 1
CyNumConcurrentSymRequests = 512
CyNumConcurrentAsymRequests = 64
statsGeneral = 1
statsDc = 1
statsDh = 1
statsDrbg = 1
statsDsa = 1
statsEcc = 1
statsKeyGen = 1
statsLn = 1
statsPrime = 1
statsRsa = 1
statsSym = 1
StorageEnabled = 0
PkeServiceDisabled = 0
AutoResetOnError = 0
PmIdleInterruptDelay = 0
PmIdleSupport = 1
KptEnabled = 1
KptMaxSWKPerFn = 1
KptMaxSWKPerPASID = 1
KptMaxSWKLifetime = 31536000
KptSWKShared = 1
[KERNEL]
NumberCyInstances = 0
```

```
NumberDcInstances = 0
[SHIM]
NumberCyInstances = 1
NumberDcInstances = 0
NumProcesses = 1
LimitDevAccess = 1
Cy0Name = "UserCY0"
Cy0IsPolled = 1
Cy0CoreAffinity = 2
```

## 5. Create copies of the file:

```
cp 4xxx_dev0.conf 4xxx_dev1.conf ; cp 4xxx_dev0.conf 4xxx_dev2.conf ;
cp 4xxx_dev0.conf 4xxx_dev3.conf
```

- For "4xxx\_dev1.conf", change the value of "Cy0CoreAffinity" to 3
- For "4xxx\_dev2.conf", change the value of "Cy0CoreAffinity" to 4
- For "4xxx\_dev3.conf", change the value of "Cy0CoreAffinity" to 5

## 6. Create the following file called "4xxxvf\_dev0.conf":

```
[GENERAL]
ServicesEnabled = asym

## 7. Run the following commands:

```
for i in {1..63}
do
    cp 4xxxvf_dev0.conf 4xxxvf_dev${i}.conf
done
tar -cf mod_qat_conf.tar.gz 4xxx*conf
```

8. Remove the "vfio\_pci" module of your worker node using "ssh core@<name\_of\_worker>  
sudo modprobe -r vfio\_pci"
9. Run the following commands to setup the QAT changes:  

```
oc cp mod_qat_conf.tar.gz qat-driver:/etc  
oc exec qat-driver -- tar -C /etc -xf /etc/mod_qat_conf.tar.gz  
oc exec qat-driver -- service qat_service stop  
oc exec qat-driver -- service qat_service start
```
10. Run the following commands to setup NGINX and QAT Engine with QAT HW:  

```
oc cp install_nginx.sh qat-driver:/home  
oc cp qat_hw_setup.sh qat-driver:/home  
oc exec qat-driver -- /home/install_nginx.sh  
oc exec qat-driver -- /home/qat_hw_setup.sh
```
11. Use the following command to create the certificate and key to use for NGINX:  

```
openssl req -x509 -newkey rsa:4096 -keyout server.key -out server.crt -days 365 -nodes
```
12. Create the following file called "nginx\_test\_qatengine.conf":

```
user root;  
load_module /usr/lib64/nginx/ngx_ssl_engine_qat_module.so;  
worker_processes 32;  
#ssl_engine qat;  
worker_rlimit_nofile 30000;  
  
events  
{  
    use epoll;  
    worker_connections 200000;  
    #multi_accept on;  
}  
ssl_engine {  
    use_engine qatengine;  
    default_algorithms RSA,EC,DH,PKEY_CRYPTO;  
    qat engine {  
        qat_offload_mode async;  
        qat_notify_mode poll;  
        #qat_poll_mode heuristic;  
        #qat_shutting_down_release on;  
    }  
}  
http  
{  
    ssl_buffer_size 64k;  
    keepalive_timeout 100;  
    include      /usr/share/nginx/conf/mime.types;  
    default_type application/octet-stream;  
    sendfile on;  
  
    server  
{  
        listen      4400 ssl reuseport backlog=200000;  
        server_name localhost;  
        access_log off;
```

```
        sendfile on;
        #ssl                  on;
        ssl_asynch          on;
        ssl_certificate      /home/server.crt;
        ssl_certificate_key  /home/server.key;

        ssl_session_timeout  5m;
        ssl_ecdh_curve       X448;

        ssl_protocols  TLSv1.3;
        ssl_ciphers ALL;

        ssl_prefer_server_ciphers  on;

        location /
        {
            root   html;
            index  index.html index.htm;
        }
    }
}
```

13. Create the following file called "nginx\_test\_software.conf":

```
user root;
worker_processes 32;
#ssl_engine qat;
worker_rlimit_nofile 30000;
#pid  /usr/local/nginx/logs/nginx.pid;

events
{
    use epoll;
    worker_connections 200000;
    #multi_accept on;
}

http
{
    ssl_buffer_size 64k;
    keepalive_timeout 100;
    include         /usr/share/nginx/conf/mime.types;
    default_type   application/octet-stream;
    sendfile on;

    server
    {
        listen       4400 ssl reuseport backlog=200000;
        server_name  localhost;
        access_log  off;
        sendfile on;
```

```
#ssl          on;
#ssl_asynch    on;
ssl_certificate /home/server.crt;
ssl_certificate_key /home/server.key;

ssl_session_timeout 5m;
ssl_ecdh_curve X448;

ssl_protocols TLSv1.3;
ssl_ciphers ALL;

ssl_prefer_server_ciphers on;

location /
{
    root   html;
    index  index.html index.htm;
}
}
```

14. Create the following file called "openssl\_clients.sh":

```
#!/bin/bash

$(( $(date +%s) - $starttime)) $(( $waitstarttime - $starttime))
rm -rf ./test_*

```

15. Create the following file called “openssl\_pod.yaml”:

```

apiVersion: v1
kind: Pod
metadata:
  labels:
    run: openssl-pod
    name: openssl-pod
spec:
  containers:
  - args:
    - /bin/bash
    image: ubuntu:22.04
    name: openssl-pod
    stdin: true
    nodeName: worker-0
    restartPolicy: Always

```

a. Replace “worker-0” with the name of the worker node you are using

16. Create the following file called “run\_nginx\_test.sh”:

```

#!/bin/bash

read -p '$Please enter number of cores to test with\n' num_cores

# Modify worker processes for NGINX
oc cp nginx_test_qatengine.conf qat-driver:/home
oc cp nginx_test_software.conf qat-driver:/home
oc cp server.crt qat-driver:/home
oc cp server.key qat-driver:/home
#oc cp driver_nginx_setup.sh qat-driver:/home
#oc exec qat-driver -- /home/driver_nginx_setup.sh
oc cp openssl_clients.sh openssl-pod:/home

nginx_ip=$(oc exec qat-driver -- ip a | grep -A 3 eth | grep "inet " | awk
'{print $2;}' | awk -F"/" '{print $1;}'')
oc exec openssl-pod -- sed -i "s/localhost/${nginx_ip}/"
/home/openssl_clients.sh

oc exec openssl-pod -- sed -i "s/5-31,69-95/${( ${num_cores} + 2 )}-
31,$(( ${num_cores} + 66 ))-95/" /home/openssl_clients.sh

echo "Running the core SW test"

oc exec qat-driver -- taskset -c "1-${num_cores},65-$(( ${num_cores} + 64 ))"
nginx -c /home/nginx_test_software.conf

oc exec openssl-pod -- /home/nginx_test_sw.sh > coresw_results.log &
sleep 150

```

```
oc exec qat-driver -- pkill nginx
sleep 10
echo "Running the QAT test"
oc exec qat-driver -- taskset -c "1-${num_cores},65-$(( ${num_cores} + 64 ))" nginx -c /home/nginx_test_qatengine.conf
oc exec openssl-pod -- /home/nginx_test_qengine.sh > qat_results.log &
sleep 150
oc exec qat-driver -- pkill nginx
```

17. Run the file "run\_nginx\_test.sh" to perform the testing and generate the results for the out-of-box SW and QAT HW (2 devices) configurations.
18. To generate the results for the QAT HW (1 device) configuration, change the number of worker processes in the "nginx\_test\_qatengine.conf" from 32 to 16 and rerun the "run\_nginx\_test.sh" file.
  - a. Rename the "coresw\_results.log" and "qat\_results.log" files from the previous step first to prevent them from being overwritten
  - b. The "qat\_results.log" file in this run will correspond to the results of this configuration
  - c. After this test is complete, revert the number of worker processes in the "nginx\_test\_qatengine.conf" back to 32
19. Create the following file called "qat\_sw\_setup.sh":

```
#!/bin/bash

export QAT_ENGINE_VERSION="v0.6.18"

cd /home
git clone --depth 1 -b $QAT_ENGINE_VERSION https://github.com/intel/QAT_Engine

git clone --depth 1 https://github.com/intel/ipp-crypto
git clone --depth 1 https://github.com/intel/intel-ipsec-mb

# Install QAT Engine

yum install -y autoconf automake libtool openssl-devel
rpm -ivh nasm-2.15.03-3.el8.x86_64.rpm

cd /home/ipp-crypto/sources/ippcp/crypto_mb
cmake . -B"../build" -DOPENSSL_INCLUDE_DIR=/usr/include/openssl -DOPENSSL_LIBRARIES=/usr/lib64 -DOPENSSL_ROOT_DIR=/usr/bin/openssl
cd ..../build
make crypto_mb && make install

cd /home/intel-ipsec-mb
make && make install LIB_INSTALL_DIR=/usr/lib64

cd /home/QAT_Engine
./autogen.sh
./configure --disable-qat_hw --enable-qat_sw
make && make install
```

20. Download "nasm-2.15.03-3.el8.x86\_64.rpm" from the Red Hat Package Browser (<https://access.redhat.com/downloads/content/package-browser>). Note that you will need to have a Red Hat account to access this page
21. For setting up the QAT SW configuration, follow these commands:

```
oc cp qat_sw_setup.sh qat-driver:/home
oc cp nasm-2.15.03-3.el8.x86_64.rpm qat-driver:/home
oc exec -it qat-driver -- /bin/bash
cd /home/QAT_Engine
make uninstall ; make clean
cd /home
rm -rf QAT_Engine
/home/qat_sw_setup.sh
exit
```
22. Run the "run\_nginx\_test.sh" file to generate the QAT SW results in the "qat\_results.log" file.
  - a. Rename the "qat\_results.log" file from step 18 first to prevent it from being overwritten

## 5.3 QATzip

QATzip is a user space library which builds on top of the Intel® QuickAssist Technology user space library, to provide extended accelerated compression and decompression services by offloading the actual compression and decompression request(s). QATzip produces data using the standard gzip\* format (RFC1952) with extended headers or lz4 blocks with lz4 frame format. The data can be decompressed with a compliant gzip\* or lz4 implementation. QATzip is designed to take full advantage of the performance provided by Intel® QuickAssist Technology.

In order to compare the value proposition for QATzip, the compression throughput, decompression throughput, and compression ratio can be gathered to review the value proposition of QAT offload in this use case.

## 5.4 VPP IPSec

Vector Packet Processor (VPP) Internet Protocol Security (IPSec) is generally used for firewall or VPN applications and provides secure remote access to onsite servers. For a given platform, the VPP IPSec workload can demonstrate the effectiveness of its crypto processing capabilities.

For the Intel VRC for NFVI Plus Platform, ensure that the results of the system follow the expected results as shown in [Table 10](#), to baseline the performance of the platform.

**Table 9. VPP IPSec Workload Configuration**

Ingredient	Software Version Details
VPP	23.02
DPDK	21.11.2
T-Rex	v3.00
IPSec MB	1.3

**Table 10. Plus Platform VPP IPsec Performance Requirements**

Packet Size (bytes)	Optimized SW <sup>1</sup> Throughput (Gbps)	Out-of-box Software <sup>2</sup> Throughput (Gbps)
64	19.00	0.40
128	28.98	0.50
256	44.47	1.00
512	62.48	2.50
1024	91.54	5.00
1280	99.42	5.99
1450	99.96	6.99

**Note:** <sup>1</sup> Uses IPsecMB crypto handler

<sup>2</sup> Uses openssl crypto handler

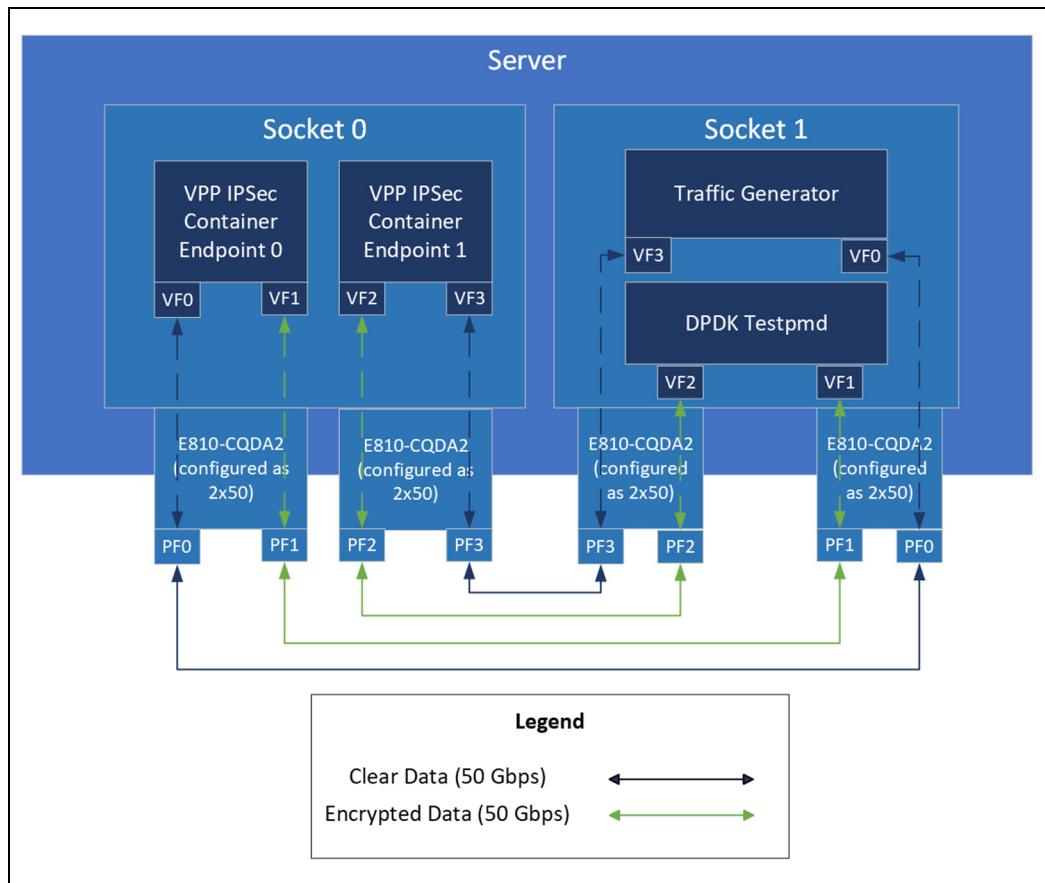

## 5.4.1 VPP IPsec Test Methodology

### 5.4.1.1 Setup

In order to perform the VPP IPsec benchmark testing, the system under test must be setup as shown in [Figure 4](#).

Each socket of the system must contain four 50Gbps NIC ports to be connected to each other. Socket 0 will host the VPP IPsec container endpoints while socket 1 will host the traffic generator and also use the DPDK testpmd application as a simple switch. The generated traffic will flow bidirectionally throughout the setup. On socket 1, the two ports receiving the clear data should be used for the traffic generator, while the two ports receiving the encrypted data should run the DPDK testpmd application to forward the traffic to the other port.

**Figure 4. Test Setup for VPP IPSec**

To run the VPP IPSec testing, the first step is to configure the NIC devices to have a total of four 50Gb/s ports available for each socket of the worker node server. Download the Ethernet Port Configuration Tool (EPCT) from this link: <https://www.intel.com/content/www/us/en/download/19437/ethernet-port-configuration-tool-linux.html?wapkw=ether%20net%20port%20config%20tool>. Follow the EPCT instructions to configure the NIC devices.

Following this, it is necessary to utilize the SR-IOV Network Operator to create VFs of the NIC ports to be used in the VPP IPSec endpoints. From the Red Hat OpenShift web console of the cluster, navigate to the OperatorHub and search for the SR-IOV Network Operator. Install the operator, then navigate to the "Installed Operators" tab.

Click on the "SR-IOV Network Operator" and create an instance of the Sriov Network Node Policy. Under "nicSelector," select "rootDevices" and provide the PCI address of the first NIC port that will be used. Change the "resourceName" to the name of the network device followed by "\_vf", and change "numVfs" to 1. Press "Create" and repeat this step for the other 7 NIC ports that will be used. Once completed, the worker node will automatically restart to apply the settings.

### 5.4.1.2 Testing Procedure

Follow these steps in order to run the VPP IPSec testing workload:

1. Create the following file called "setup\_vpp.sh":

```
#!/bin/bash

read -p '$Before proceeding, please make sure you have modified the ipsec.cli
files in the ep0 and ep1 directories to use the appropriate MAC address in your
setup (lines 1033 and 1035).\\nAdditionally, please modify the vpp_ep0.yaml and
vpp_ep1.yaml files to use the appropriate network devices VFs for your setup.\\nIt
is also necessary to run the commands "sudo ip link set <nice_device> vf 0 spoof
off" and "sudo ip link set <nice_device> vf 0 trust on" for each NIC VF that will
be used.\\nPress Enter to continue.'
```

```
oc delete pod vpp-ep0
oc delete pod vpp-ep1
oc delete pod dpdk-pod
oc delete pod trex-pod

for i in 0 1
do
    oc create -f vpp_ep${i}.yaml
    sleep 120
    oc cp get-vpp.sh vpp-ep${i}:/home
    oc cp install_vpp.sh vpp-ep${i}:/home
    oc cp ep${i} vpp-ep${i}:/home
    oc exec vpp-ep${i} -- /home/install_vpp.sh
done

./setup_dpdk_pod.sh
./setup_trex_pod.sh
```

2. Create the following file called "install\_vpp.sh":

```
#!/bin/bash

apt-get update
apt-get install -y --no-install-recommends apt-transport-https ca-certificates
curl gnupg iproute2 iputils-ping kmod pciutils
rm -rf /var/lib/apt/lists/*

mkdir /vpp
mv /home/get-vpp.sh /vpp
cd /vpp
set -eux; ./get-vpp.sh
apt-get update
apt-get install -y -V ./*.deb
dpkg-query -f '${Version}\\n' -W vpp > /vpp/version
rm -rf vom*.deb vpp-dbg*.deb
rm -rf /var/lib/apt/lists/*

mkdir -p /var/log/vpp
```

```
cd /home
```

3. Create the following file called "get\_vpp.sh":

```
#!/bin/bash

[ -z "$REPO_URL" ] &&
REPO_URL="https://packagecloud.io/install/repositories/fdio/${REPO:=release}""

# the code below comes from FDio's CSIT project.
function get_vpp () {

if [ "${INSTALL:-false}" = true ]; then
apt-get -y install "${artifacts[@]}" || {
die "Install VPP artifacts failed."
}
else
apt-get -y download "${artifacts[@]}" || {
die "Download VPP artifacts failed."
}
fi
}

function die () {
# Print the message to standard error and exit with error code specified
# by the second argument.
#
# Hardcoded values:
# - The default error message.

```

```
# Arguments:
# - ${1} - The whole error message, be sure to quote. Optional
# - ${2} - the code to exit with, default: 1.

set -x
set +eu
echo "${1:-Unspecified run-time error occurred!}"
exit "${2:-1}"
}

get_vpp
```

4. Create the following file called "vpp\_ep0.yaml":

```
apiVersion: v1
kind: Pod
metadata:
  labels:
    run: vpp-ep0
  name: vpp-ep0
spec:
  containers:
    - args:
        - /bin/bash
      image: ubuntu
      name: vpp-ep0
      stdin: true
      securityContext:
        runAsUser: 0
      capabilities:
        add: ["IPC_LOCK", "SYS_RESOURCE", "NET_RAW"]
    volumeMounts:
      - mountPath: /dev/hugepages
        name: hugepage
    resources:
      limits:
        memory: "50Gi"
        hugepages-1Gi: "50Gi"
        openshift.io/<sock0_port_0>: 1
        openshift.io/<sock0_port_1>: 1
      requests:
        memory: "50Gi"
        hugepages-1Gi: "50Gi"
        openshift.io/<sock0_port_0>: 1
        openshift.io/<sock0_port_1>: 1
    volumes:
      - name: hugepage
        emptyDir:
          medium: HugePages
  nodeName: worker-0
  restartPolicy: Always
```

- a. Replace "<sock0\_port\_0>" and "<sock0\_port\_1>" with the names of the corresponding Sriov Network Node policies created in the section above for PF0 and PF1 of socket 0. Replace "worker-0" with the name of your worker node being used.

5. Create the following file called "vpp\_ep1.yaml":

```

apiVersion: v1
kind: Pod
metadata:
  labels:
    run: vpp-ep1
  name: vpp-ep1
spec:
  containers:
  - args:
    - /bin/bash
    image: ubuntu
    name: vpp-ep1
    stdin: true
    securityContext:
      runAsUser: 0
    capabilities:
      add: ["IPC_LOCK", "SYS_RESOURCE", "NET_RAW"]
  volumeMounts:
  - mountPath: /dev/hugepages
    name: hugepage
  resources:
    limits:
      memory: "50Gi"
      hugepages-1Gi: "50Gi"
      openshift.io/<sock0_port_2>_vf: 1
      openshift.io/<sock0_port_3>_vf: 1
    requests:
      memory: "50Gi"
      hugepages-1Gi: "50Gi"
      openshift.io/<sock0_port_2>_vf: 1
      openshift.io/<sock0_port_3>_vf: 1
  volumes:
  - name: hugepage
    emptyDir:
      medium: HugePages
  nodeName: worker-0
  restartPolicy: Always

```

- a. Replace "<sock0\_port\_2>" and "<sock0\_port\_3>" with the names of the corresponding Sriov Network Node policies created in the section above for PF2 and PF3 of socket 0. Replace "worker-0" with the name of your worker node being used.

6. Create the following file called "dpdk\_pod.yaml":

```

apiVersion: v1
kind: Pod

```

```

metadata:
  labels:
    run: dpdk-pod
    name: dpdk-pod
spec:
  containers:
    - args:
        - /bin/bash
      image: ubuntu
      name: dpdk-pod
      stdin: true
      securityContext:
        runAsUser: 0
      capabilities:
        add: ["IPC_LOCK", "SYS_RESOURCE", "NET_RAW"]
  volumeMounts:
    - mountPath: /dev/hugepages
      name: hugepage
  resources:
    limits:
      memory: "30Gi"
      hugepages-1Gi: "10Gi"
      openshift.io/<sock1_port_1>_vf: 1
      openshift.io/<sock1_port_2>_vf: 1
    requests:
      memory: "30Gi"
      hugepages-1Gi: "10Gi"
      openshift.io/<sock1_port_1>_vf: 1
      openshift.io/<sock1_port_2>_vf: 1
  volumes:
    - name: hugepage
      emptyDir:
        medium: HugePages
  nodeName: worker-0
  restartPolicy: Always

```

- a. Replace "<sock1\_port\_1>" and "<sock1\_port\_2>" with the names of the corresponding Srios Network Node policies created in the section above for PF1 and PF2 of socket 1. Replace "worker-0" with the name of your worker node being used.

7. Create the following file called "setup\_dpdk\_pod.sh":

```

#!/bin/bash

oc create -f dpdk_pod.yaml
wget http://fast.dpdk.org/rel/dpdk-21.11.2.tar.xz
sleep 120
oc cp dpdk-21.11.2.tar.xz dpdk-pod:/home
oc cp run_testpmd.sh dpdk-pod:/home
oc cp install_dpdk.sh dpdk-pod:/home
oc exec dpdk-pod -- /home/install_dpdk.sh

```

## 8. Create the following file called "install\_dpdk.sh":

```
#!/bin/bash

apt update -y
apt install -y kmod pciutils iproute2 meson python3-pyelftools libnuma-dev

cd /home
tar -xf dpdk-21.11.2.tar.xz
cd dpdk-stable-21.11.2
meson setup -Dexamples=all build
cd build
ninja
ninja install
ldconfig
```

## 9. Create the following file called "run\_testpmd.sh":

```
#!/bin/bash

/home/dpdk-stable-21.11.2/build/app/dpdk-testpmd -l 42-47 -n 4 --socket-mem=0,4096
-a <sock1_port_1> -a <sock1_port_2> --main-lcore=42 --in-memory
```

a. Replace "<sock1\_port\_1>" and "<sock1\_port\_2>" with the PCI addresses (ex: 81:09.0) of the Ethernet Adaptive Virtual Functions created for the NIC ports corresponding to PF1 and PF2 of socket 1.

## 10. Create the following file called "trex\_pod.yaml":

```
apiVersion: v1
kind: Pod
metadata:
  labels:
    run: trex-pod
  name: trex-pod
spec:
  containers:
  - args:
    - /bin/bash
    image: python
    name: trex-pod
    stdin: true
    securityContext:
      runAsUser: 0
    capabilities:
      add: ["IPC_LOCK", "SYS_RESOURCE", "NET_RAW"]
  volumeMounts:
  - mountPath: /dev/hugepages
    name: hugepage
  resources:
    limits:
      memory: "10Gi"
      hugepages-1Gi: "10Gi"
```

```

    openshift.io/<sock1_port_0>: 1
    openshift.io/<sock1_port_3>: 1
  requests:
    memory: "10Gi"
    hugepages-1Gi: "10Gi"
    openshift.io/<sock1_port_0>: 1
    openshift.io/<sock1_port_3>: 1
  volumes:
  - name: hugepage
    emptyDir:
      medium: HugePages
  nodeName: worker-0
  restartPolicy: Always

```

- a. Replace "<sock1\_port\_0>" and "<sock1\_port\_3>" with the names of the corresponding Srios Network Node policies created in the section above for PF0 and PF3 of socket 1. Replace "worker-0" with the name of your worker node being used.

**11. Create the following file called "setup\_trex\_pod.sh":**

```

#!/bin/bash

oc create -f trex_pod.yaml
wget --no-check-certificate https://trex-tgn.cisco.com/trex/release/v3.00.tar.gz
sleep 30
oc cp v3.00.tar.gz trex-pod:/home
oc cp vpp_packets_p0.py trex-pod:/home
oc cp vpp_packets_p1.py trex-pod:/home
oc cp install_trex.sh trex-pod:/home
oc cp trex_cfg.yaml trex-pod:/etc

oc run toolkit-pod --image=registry.redhat.io/openshift4/driver-toolkit-
rhel8:v4.12.0-202301171655.p0.ge31abf2.assembly.stream -- sleep infinity
sleep 30
oc cp toolkit-pod:/lib/modules ./modules
oc cp toolkit-pod:/usr/src/kernels ./kernels
oc cp modules trex-pod:/lib/
oc cp kernels trex-pod:/usr/src/
oc delete pod toolkit-pod

oc exec trex-pod -- /home/install_trex.sh

```

- a. Note that this step assumes that the kernel version being used is 4.18.0-372.40.1.el8\_6.x86\_64. If a different version is being used, the image version being used in line 12 needs to be changed so that the kernel source files in the image are the same as the kernel version being used. The different versions of this image can be found at:  
<https://catalog.redhat.com/software/containers/openshift4/driver-toolkit-rhel8/604009d6122bd89307e00865?container-tabs=gti>

**12. Create the following file called "trex\_cfg.yaml":**

```

- version      : 2
  interfaces   : ["<sock1_port_0>","<sock1_port_3>"]

```

```

port_limit      : 2

enable_zmq_pub : true
zmq_pub_port   : 4500
zmq_rpc_port   : 4501
limit_memory: 8192
rx_desc : 1024
tx_desc : 1024
c : 7
port_bandwidth_gb : 50
services_core : 32
port_info:
  - dst_mac: "<sock0_port0_vf_mac>" # Socket 0 Port 0 MAC
    src_mac : "<sock1_port0_vf_mac>" # Socket 1 Port 0 MAC
  - dst_mac: "<sock0_port3_vf_mac>" # Socket 0 Port 3 MAC
    src_mac : "<sock1_port3_vf_mac>" # Socket 1 Port 3 MAC

platform :
  master_thread_id : 33
  latency_thread_id : 34
  dual_if :
    - socket : 1
      threads : [35,36,37,38,39,40,41]

```

- a. Replace <sock1\_port\_0> and <sock1\_port\_3> with the corresponding PCI address of the VFs for PF0 and PF3 of socket 1. Replace <sock0\_port0\_vf\_mac>, <sock1\_port0\_vf\_mac>, <sock0\_port3\_vf\_mac>, and <sock1\_port3\_vf\_mac> with the corresponding MAC address of the VF for each port.

13. Create the following file called "vpp\_packets\_p0.py":

```

from trex_stl_lib.api import *
import argparse

class STLS1(object):

    def __init__ (self):
        self.mode = 0
        self.fsize = 64; # the size of the packet
        self.tunnels = 128; # number of VPP IPSec tunnels being used

    def create_pkt_base (self,addr):
        pkt_dst = "10.64.0." + str(addr)
        t=[

Ether(dst="")/IP(src="192.168.105.3",dst=pkt_dst)/UDP(dport=1024,sport=49000),  

Ether()/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/UDP(dport=12,sport=1025),  

Ether()/Dot1Q(vlan=12)/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/UDP(dport=12,sport=1025),  

Ether()/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/TCP(dport=12,sport=1025),

```

```

        Ether() / Dot1Q(vlan=12) / Ipv6(src="::5") / TCP(dport=12, sport=1025),
        Ether() / IP() / UDP() / Ipv6(src="::5") / TCP(dport=12, sport=1025)
    ];
    return t[self.mode]

def create_stream (self):

    # Create base packet and pad it to size
    size = self.fsize - 4; # HW will add 4 bytes ethernet FCS
    profile = []
    for i in range(1,self.tunnels + 1):
        base_pkt = self.create_pkt_base(i)
        pad = max(0, size - len(base_pkt)) * 'x'
        pkt = STLPktBuilder(pkt = base_pkt/pad,
                           vm = [])
        profile.append(STLStream(packet = pkt, mode = STLTXCont()))
    return STLProfile(profile).get_streams()

def get_streams (self, tunables, **kwargs):
    parser = argparse.ArgumentParser(description='Argparser for
{}' .format(os.path.basename(__file__)),
formatter_class=argparse.ArgumentDefaultsHelpFormatter)

    args = parser.parse_args(tunables)
    # create 1 stream
    return self.create_stream()

# dynamic load - used for trex console or simulator
def register():
    return STLS1()
a. Replace <sock0_port0_vf_mac> with the corresponding MAC address of the VF for
port 0 in socket 0

```

**14. Create the following file called "vpp\_packets\_p1.py":**

```

from trex_stl_lib.api import *
import argparse

class STLS1(object):

    def __init__ (self):
        self.mode = 0
        self.fsize = 64; # the size of the packet
        self.tunnels = 128; # number of VPP IPSec tunnels being used

    def create_pkt_base (self,addr):
        pkt_dst = "20.64.0." + str(addr)
        t=[

```

```

Ether(dst="")/IP(src="192.168.115.3",dst=pkt_dst)/UDP(dport=10
24,sport=49000),

Ether()/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/UDP(dport=12,sport=1025),

Ether()/Dot1Q(vlan=12)/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/UDP(dport=
12,sport=1025),

Ether()/Dot1Q(vlan=12)/IP(src="16.0.0.1",dst="48.0.0.1")/TCP(dport=12,sport=1025),
    Ether()/Dot1Q(vlan=12)/Ipv6(src="::5")/TCP(dport=12,sport=1025),
    Ether()/IP()/UDP()/Ipv6(src="::5")/TCP(dport=12,sport=1025)
];
return t[self.mode]

def create_stream (self):

    # Create base packet and pad it to size
    size = self.fsize - 4; # HW will add 4 bytes ethernet FCS
    profile = []
    for i in range(1,self.tunnels + 1):
        base_pkt = self.create_pkt_base(i)
        pad = max(0, size - len(base_pkt)) * 'x'
        pkt = STLPktBuilder(pkt = base_pkt/pad,
                            vm = [])
        profile.append(STLStream(packet = pkt, mode = STLTXCont()))
    return STLProfile(profile).get_streams()

def get_streams (self, tunables, **kwargs):
    parser = argparse.ArgumentParser(description='Argparser for
{}'.format(os.path.basename(__file__)),
formatter_class=argparse.ArgumentDefaultsHelpFormatter)

    args = parser.parse_args(tunables)
    # create 1 stream
    return self.create_stream()

# dynamic load - used for trex console or simulator
def register():
    return STLS1()
a. Replace <sock0_port3_vf_mac> with the corresponding MAC address of the VF for
port 3 in socket 0

```

**15. Create the following file called "install\_trex.sh":**

```

#!/bin/bash

apt update -y ; apt install -y vim kmod pciutils file tmux iproute2 meson python3-
pyelftools

cd /home

```

```
tar -xf v3.00.tar.gz

mv vpp_packets_p0.py vpp_packets_p1.py v3.00/stl

cd /usr/lib/x86_64-linux-gnu/
ln -s -f libc.a liblibc.a

sed -i 's/collections.Hashable/collections.abc.Hashable/'
/home/v3.00/external_libs/pyyaml-3.11/python3/yaml/constructor.py
```

16. Create the directories ep0 and ep1:

```
mkdir ep0
mkdir ep1
```

17. Inside directory ep0, create the following file called "start\_vpp\_native.sh"

```
#!/bin/bash
vpp -c /home/ep0/startup_native.conf
exit 0
```

18. In the directory ep0, create the following file called "start\_vpp\_qat\_sw.sh":

```
#!/usr/bin/env bash
vpp -c /home/ep0/startup_qat_sw.conf
exit 0
```

19. Inside directory ep0, create the following file called "startup\_native.conf":

```
unix {
    nodaeamon
    log /var/log/vpp/vpp.log
    full-coredump
    cli-listen /run/vpp/cli.sock
    gid vpp
    interactive
    exec /home/ep0/ipsec.cli
}

logging {
    size 4096
    default-log-level debug
    default-syslog-log-level debug
}

api-trace {
    ## This stanza controls binary API tracing. Unless there is a very strong
    reason,
    ## please leave this feature enabled.
    On
    ## Additional parameters:
    ##
    ## To set the number of binary API trace records in the circular buffer,
    configure nitems
```

```

## 
## nitems <nnn>
##
## To save the api message table decode tables, configure a filename. Results in
/tmp/<filename>
## Very handy for understanding api message changes between versions,
identifying missing
## plugins, and so forth.
##
## save-api-table <filename>
}

api-segment {
    gid vpp
}

socksvr {
    default
}

cpu {
    ## In the VPP there is one main thread and optionally the user can create
    worker(s)
    ## The main thread and worker thread(s) can be pinned to CPU core(s)
    manually or automatically

    ## Manual pinning of thread(s) to CPU core(s)

    ## Set logical CPU core where main thread runs, if main core is not set
    ## VPP will use core 1 if available
    main-core 0

    ## Set logical CPU core(s) where worker threads are running
    corelist-workers 1-8

    ## Automatic pinning of thread(s) to CPU core(s)

    ## Sets number of CPU core(s) to be skipped (1 ... N-1)
    ## Skipped CPU core(s) are not used for pinning main thread and working
    threads(s).
    ## The main thread is automatically pinned to the first available CPU core
    and worker(s)
    ## are pinned to next free CPU core(s) after core assigned to main thread
    # skip-cores 4

    ## Specify a number of workers to be created
    ## Workers are pinned to N consecutive CPU cores while skipping "skip-
    ## cores" CPU core(s)
    ## and main thread's CPU core
    # workers 4

    ## Set scheduling policy and priority of main and worker threads
}

```

```

if __name__ == "__main__":
    sys.exit( main(sys.argv) )

```

- a. Replace <sock1\_port2\_vf\_mac> and <sock1\_port3\_vf\_mac> with the MAC addresses of the VFs of the corresponding NIC ports.
28. In the directory ep1, run the following command to generate the "ipsec.cli" file to use for VPP:

```
python3 create_ipsec_cli_ep1.py ipsecmb aes-cbc-128 sha1-96 128
```

29. Run the "setup\_vpp.sh" script.
30. In one console window, run the following commands to start the VPP endpoints:

```
oc exec vpp-ep0 -- /home/ep0/start_vpp_native.sh &
oc exec vpp-ep1 -- /home/ep1/start_vpp_native.sh &
```

31. In a separate console window, run the following commands to start the DPDK testpmd application:

```
oc exec -it dpdk-pod /bin/bash
./run_testpmd.sh
```

32. In a separate console window, run the following commands to start the T-Rex traffic generator:

```
oc exec -it trex-pod /bin/bash
cd /home/v3.00
tmux new-session
./trex-64 -i
<detach from the tmux-session>
./trex-console
```

33. In the T-Rex console interface, use the following commands:

```
tui
start -f stl/vpp_packets_p0.py -p 0 -m 5%
start -f stl/vpp_packets_p1.py -p 1 -m 5%
```

34. Repeat step 31 by using “stop” and changing the line rate parameter (-m 5%) to find the highest rate with zero packet loss at steady state. Observe the throughput results and record the total Tx pps amount.
35. To stop the traffic, use the command “stop” and exit from the T-Rex console interface with the “quit” command twice.
36. Repeat steps 33-35 after modifying the “stl/vpp\_packets\_p0.py” and “stl\_vpp\_packets\_p1.py” files to use different packet sizes according to the baseline results provided in Section 6.4.
37. Use the following commands to stop the VPP endpoints:
 

```
oc exec vpp-ep0 -- pkill vpp
oc exec vpp-ep1 -- pkill vpp
```
38. Repeat the testing from steps 33-36 after using the following commands to start the second VPP configuration:
 

```
oc exec vpp-ep0 -- /home/ep0/start_vpp_qat_sw.sh &
oc exec vpp-ep1 -- /home/ep1/start_vpp_qat_sw.sh &
```

## 5.5 Security AI

AI inference is used in network/security to help prevent advanced cyber-attacks. In order to improve the latency associated with this application, the Intel® Xeon® Scalable Processor contains technologies to accelerate AI inference such as AVX-512 and Vector Neural Network Instructions. The Security AI workload utilizes the TensorFlow deep-learning framework, Intel® oneAPI Deep Neural Network Library (oneDNN), and Intel® Neural Compressor to improve the performance of the AI inference model.

The starting model for the security AI is an open-source deep-learning model called Malconv (<https://github.com/elastic/ember/tree/master/malconv>) which is given as a pre-trained Keras H5 format file. This model is used to detect malware within files. The performance of the model can be improved by converting it to an FP32 frozen graph model, and further still by enabling Intel® oneDNN. Finally, by using the Intel® Neural Compressor for post-training quantization, the model can become a frozen INT8 model.

For a full explanation of the security AI workload and test procedure, please refer to the following document "[Intel® Deep Learning Boost – Boost Network Security AI Inference Performance in Google Cloud Platform \(GCP\) Technology Guide](#)." Ensure that the results of the tests follow the expected results as shown in the following tables to baseline the performance of the platform.

**Table 11. Security AI Workload Configuration**

**Table 12. Plus Platform Security AI Performance Requirements**

Model Type	Inference Time (ms)
Keras h5	86.9
FP32 Frozen without oneDNN	65.0

FP32 Frozen with oneDNN	51.3
INT8 Frozen with oneDNN	25.6

## 5.5.1 Security AI Test Methodology

Follow the instructions provided below to run the Security AI inference models:

1. Create a requirements.txt file containing the required package dependencies:

```
TensorFlow
TensorFlow-estimator
keras
neural-compressor
progress
numpy
```

2. Create a script called h5\_to\_savedmodel.py to first convert the Keras h5 format to the SavedModel format:

```
import tensorflow as tf
model = tf.keras.models.load_model("malconv.h5")
model.save("malconv_saved_model")
```

3. Create a script called saved\_model\_to\_frozen.py to convert the SavedModel to the FP32 frozen graph model:

```
import sys
import tensorflow as tf
from tensorflow.python.saved_model import signature_constants
from tensorflow.python.training import saver
from tensorflow.python.framework import convert_to_constants
from tensorflow.core.protobuf import config_pb2
from tensorflow.python.grappler import tf_optimizer
from tensorflow.core.protobuf import meta_graph_pb2
from tensorflow.python.platform import gfile
from tensorflow.python.eager import context
assert context.executing_eagerly()
if len(sys.argv) != 3:
    print('Usage:')
    print(f'\tpython3 {sys.argv[0]} model_path output_pbfile')
    sys.exit(1)

model = tf.keras.models.load_model(sys.argv[1])
model.summary()

func = model.signatures[signature_constants.DEFAULT_SERVING_SIGNATURE_DEF_KEY]
frozen_func = convert_to_constants.convert_variables_to_constants_v2(func)

grappler_meta_graph_def = saver.export_meta_graph(
    graph_def=frozen_func.graph.as_graph_def(), graph=frozen_func.graph)

fetch_collection = meta_graph_pb2.CollectionDef()
for array in frozen_func.inputs + frozen_func.outputs:
    fetch_collection.node_list.value.append(array.name)
grappler_meta_graph_def.collection_def["train_op"].CopyFrom(fetch_collection)

grappler_session_config = config_pb2.ConfigProto()
rewrite_options = grappler_session_config.graph_options.rewrite_options
rewrite_options.min_graph_nodes = -1
opt = tf_optimizer.OptimizeGraph(grappler_session_config,
    grappler_meta_graph_def, graph_id=b"tf_graph")

f = gfile.GFile(sys.argv[2], 'wb')
f.write(opt.SerializeToString())
```

4. Create the following YAML config file called malconv.yaml:

```

model:
  name: malconv
  framework: tensorflow
  inputs: input_1
  outputs: Identity

tuning:
  accuracy_criterion:
    relative: 0.01                                # optional. default value
is relative, other value is absolute. this example allows relative accuracy
loss: 1%.
  exit_policy:
    timeout: 0                                     # optional. tuning
timeout (seconds). default value is 0 which means early stop. combine with
max_trials field to decide when to exit.
  max_trials: 1
  random_seed: 9527                               # optional. random seed
for deterministic tuning.

```

5. Create the following script called quantize.py to quantize the FP32 frozen model with Intel® Neural Compressor:

```

import os
import argparse
import numpy as np
from neural_compressor.experimental import Quantization, common

def parse_args():
    parser = argparse.ArgumentParser()
    parser.add_argument(
        '-m', '--input_model', type=str, dest='input_model', help='frozen fp32
model', required=True)
    parser.add_argument(
        '-c', '--input_config', type=str, dest='input_config', help='yaml
config file', required=True)
    parser.add_argument(
        '-i', '--input_path', type=str, dest='input_path', help='input
dataset', required=True)
    parser.add_argument(
        '-o', '--output_file', type=str, dest='output_file', help='output
file', required=True)
    args = parser.parse_args()
    return args

def load_dataset(input_path):
    result = []
    mal_path = os.path.join(input_path, 'MALICIOUS')
    if os.path.exists(mal_path):
        mal_files = [(1, os.path.join(mal_path, fp)) for fp in
os.listdir(mal_path)]
        result.extend(mal_files)
    clean_path = os.path.join(input_path, 'KNOWN')
    if os.path.exists(clean_path):
        clean_files = [(0, os.path.join(clean_path, fp)) for fp in
os.listdir(clean_path)]
        result.extend(clean_files)

    return result
def read_file(filepath: str, expect_size: int):
    if filepath[-4:] == '.npy':
        data = np.load(filepath, allow_pickle=True)
    else:
        data = np.fromfile(filepath, np.ubyte)

    if data.size < expect_size:

```

```

        data = np.pad(data, (0, expect_size - data.size), 'constant',
constant_values=(0, 0))
    else:
        data = data[:expect_size]

    return np.array([data])

class Dataset:
    def __init__(self, input_path):
        self.batch_size = 32
        self.dataset = load_dataset(input_path)

    def __iter__(self):
        for label, filepath in self.dataset:
            data = read_file(filepath, expect_size=1048576)
            yield data, label

    def __len__(self):
        return len(self.dataset)

if __name__ == '__main__':
    os.environ['TF_ENABLE_ONEDNN_OPTS'] = '1'
    args = parse_args()
    quantizer = Quantization(args.input_config)
    quantizer.model = common.Model(args.input_model)
    quantizer.calib_dataloader = Dataset(args.input_path)

        '-d', '--dump_path', type=str, dest='dump_path', help='save dataset
folder to pickle file', default=None)

    args = parser.parse_args()
    model = load_model(args.model_path, args)
    test = TestOnDataset(model, args.input_path)
    test.run()
    test.dump_dataset(args.dump_path)

if __name__ == '__main__':
    main()

```

**10. Create the file “run\_nfvi\_ai.sh”:**

```
#!/bin/bash
```

```
oc delete pod nfvi-ai
```

```

oc create -f nfvi_ai_pod.yaml
sleep 20

oc cp requirements.txt nfvi-ai:/home
oc cp h5_to_savedmodel.py nfvi-ai:/home
oc cp saved_model_to_frozen.py nfvi-ai:/home
oc cp quantize.py nfvi-ai:/home
oc cp malconv.yaml nfvi-ai:/home
oc cp datasets/ nfvi-ai:/home
oc cp setup_ai.sh nfvi-ai:/home
oc cp test.py nfvi-ai:/home
oc cp analyze_scores.py nfvi-ai:/home
oc cp ai_run.sh nfvi-ai:/home

oc exec nfvi-ai -- /home/setup_ai.sh
oc exec nfvi-ai -- /home/ai_run.sh

oc cp nfvi-ai:/home/logs logs/
echo "Security AI Mean Inference Times" > nfvi_ai.log
awk '{ sum += $1 } END { print "Keras h5:",sum/NR,"ms" }' logs/h5_results.log
>> nfvi_ai.log
awk '{ sum += $1 } END { print "FP32 without oneDNN:",sum/NR,"ms" }'
logs/nodnn_fp32_results.log >> nfvi_ai.log
awk '{ sum += $1 } END { print "FP32 with oneDNN:",sum/NR,"ms" }'
logs/fp32_results.log >> nfvi_ai.log
awk '{ sum += $1 } END { print "INT8 with oneDNN:",sum/NR,"ms" }'
logs/int8_results.log >> nfvi_ai.log

```

**11. Create the file “nfvi\_ai\_pod.yaml”:**

```

apiVersion: v1
kind: Pod
metadata:
  labels:
    run: nfvi-ai
    name: nfvi-ai
spec:
  containers:
    - args:
        - /bin/bash
      image: python
      name: nfvi-ai
      stdin: true
      nodeName: worker-0
      restartPolicy: Always

```

- a. Replace “worker-0” with the name of the worker node you are using

**12. Create the file “setup\_ai.sh”:**

```

#!/bin/bash

apt update ; apt install -y libglib1 numactl
cd /home
mkdir logs
wget https://raw.githubusercontent.com/elastic/ember/master/malconv/malconv.h5
pip install --upgrade pip
pip install -r requirements.txt
pip install neural-compressor
pip install numpy
python h5_to_savedmodel.py
python saved_model_to_frozen.py malconv_saved_model/ malconv_fp32.pb
TF_ENABLE_ONEDNN_OPTS=1 python quantize.py -m malconv_fp32.pb -c malconv.yaml
-i ./datasets -o malconv_int8.pb

```

- 13. You will need to provide your own testing dataset to use. Create the following directories:**

```
mkdir -p datasets/KNOWN  
mkdir datasets/MALICIOUS
```

14. Place the benign files into the “datasets/KNOWN” directory, and place the malicious files in the “datasets/MALICIOUS” directory
15. Run the “run\_nfvi\_ai.sh” script. The generated “nfvi\_ai.log” file will contain the mean inference time results of the four models tested.

§

## **6    *Summary***

---

The Intel NFVI v4 and SASE Verified Reference Configuration, is an Intel Accelerated Solution defined on 4<sup>th</sup> Gen Intel® Xeon® Scalable processors. This solution, combined with architectural improvements, feature enhancements, integrated Accelerators with high memory and IO bandwidth, provides a significant performance and scalability advantage in today's NFVI environments. These processors are optimized for network, cloud native, wireline, and wireless core-intensive workloads, and are especially suited for NFVI and SASE workload coupled using Intel® Ethernet E810-Network Controllers and Data Plane Development Kit.
