Telelogos x intel®

Driving Business Communication Through Intelligent Digital Signage

Broadcasting: With the combination of Telelogos Media4Display software running on premium 11th Gen Intel® Core™ processor-based players, corporations get more from their Digital Signage infrastructure, leveraging real-time access to data sources and AI to generate new use cases and create more business value. The solution allows creation, management, and scheduling of multimedia content across distributed screens, with native API capabilities and seamless integration with enterprise systems (ERP, CRM, Power BI, IoT...). Powered by Intel® architecture, Telelogos Media4display software benefits from higher performance, security, and integration flexibility compared to SoC or Android-based players.

Narrowcasting: Physical and cyber security reach a new level for corporations running Telelogos Channels, the alert and push communication solution of Telelogos, on the Intel-based workstations of their employees. Channels makes it possible to communicate information directly to the employees on their computer and their mobile without modifying their working habits.
